

A KALEIDOSCOPE OF STORMWATER OPTIONS

- THE NEXT GENERATION FOR KINGSTON

Georgie Wettenhall and Alan West

Background

- Integrated Water Cycle Strategy adopted in 2012
- Vision and guiding principles
- Sets targets:
 - Stormwater treatment
 - Potable water reduction

Stormwater treatment and reuse prioritisation project

- What is the optimal combination of works to meet targets?
- How much will it cost?
- How should works be prioritised?
- What are the benefits of works?

City of Kingston context

- Minimal greenfield development
- Catchment boundaries do not align with municipal boundary
- Committed to WSUD including many streetscape raingardens
- Pumps used as part of minor/major drainage systems for significant proportion of municipality

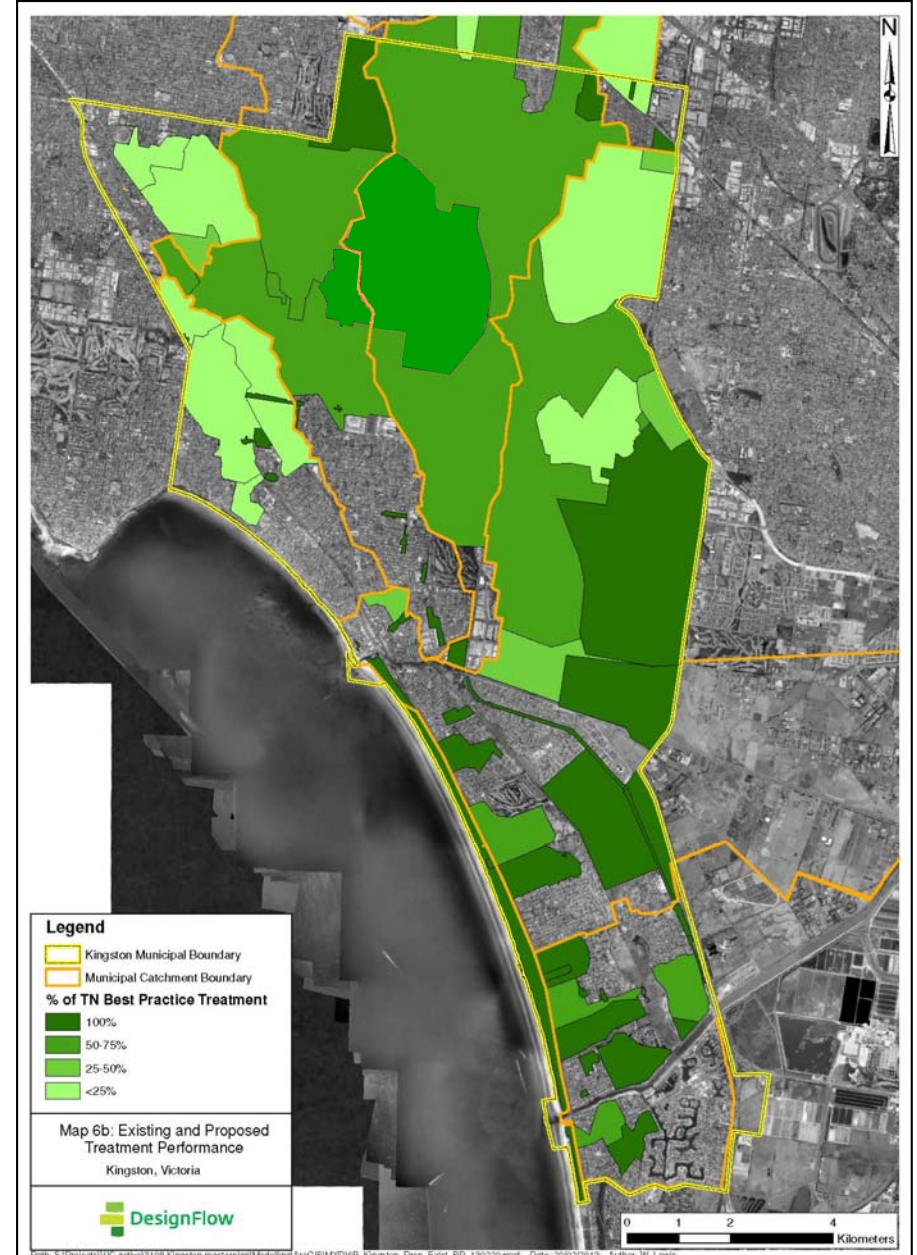

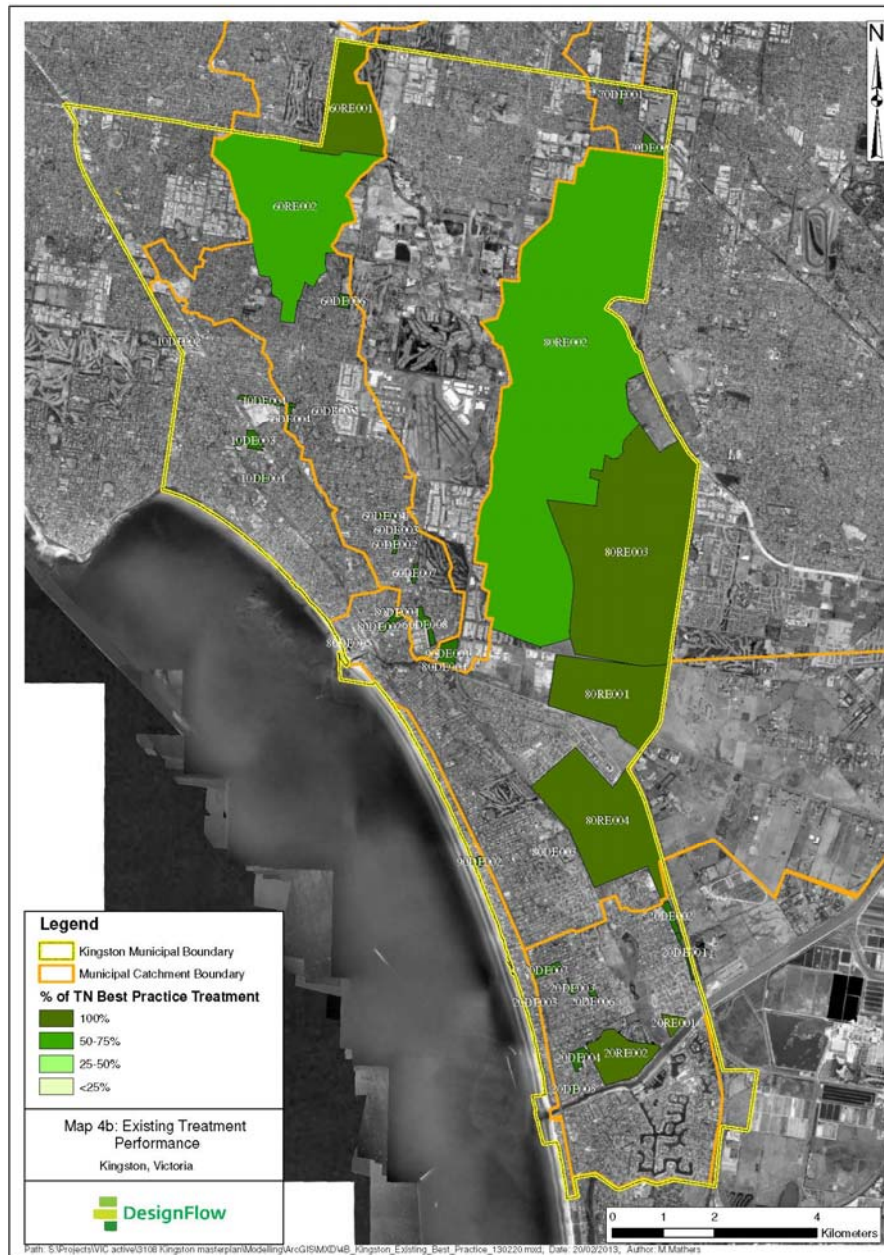

Path: S:\Projects\VIC active\3108 Kingston masterplan\Modelling\ArcGIS\MXD\1_Kingston_MW_Drainage_130131.mxd, Date: 31/01/2013, Author: M. Mathers

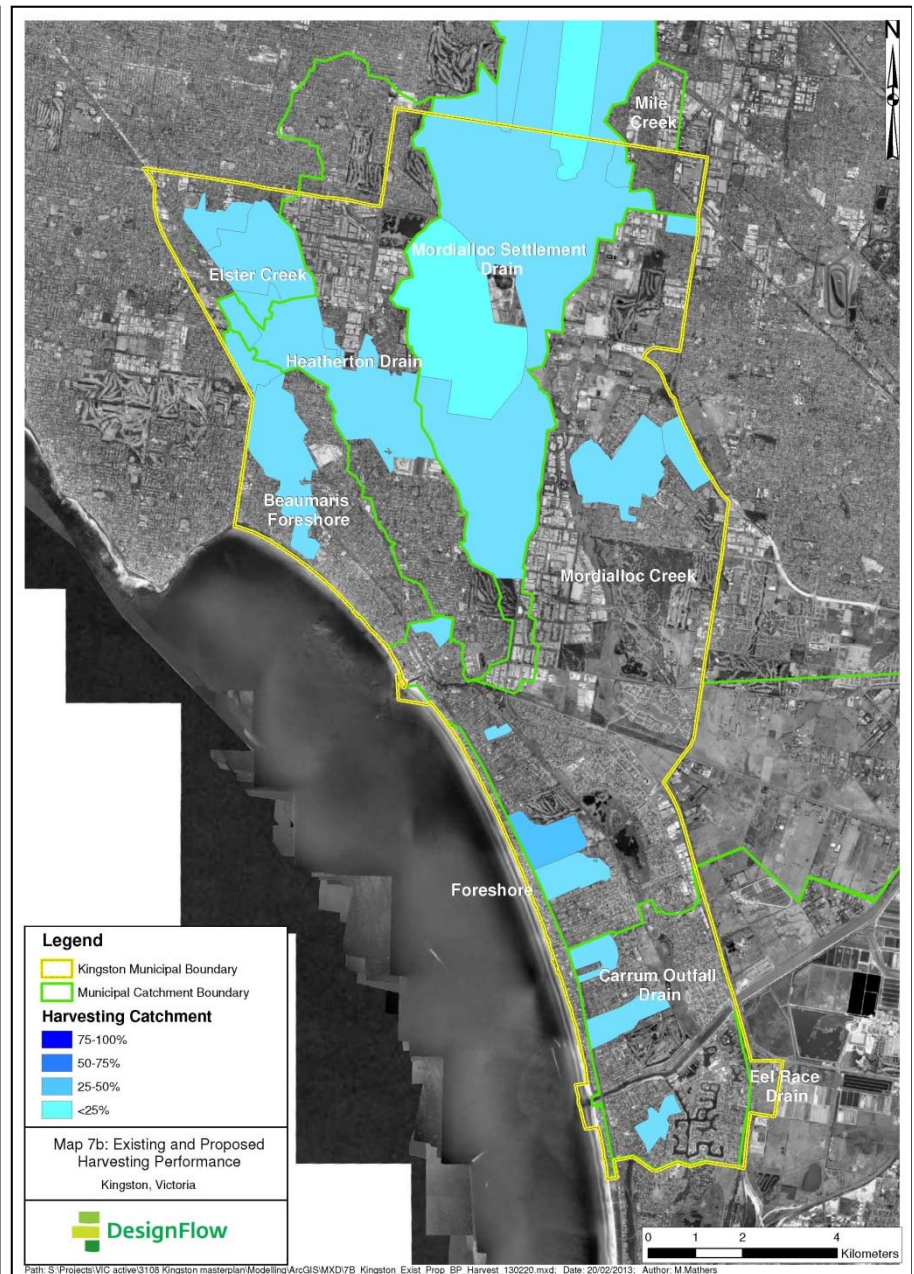

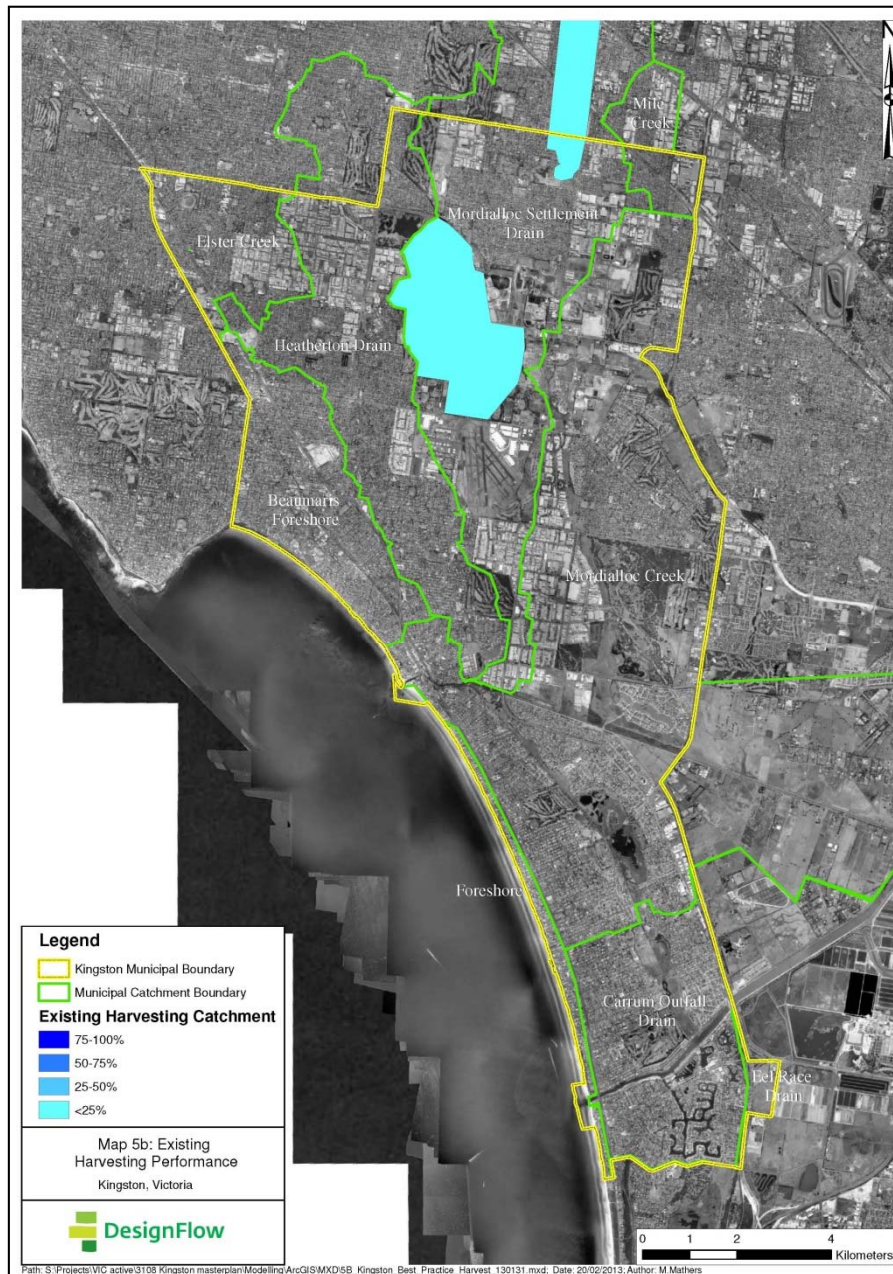

Project outputs

1. **Maps:** Location & performance of existing & proposed assets
2. **Opportunity prioritisation:** System for ranking opportunities based on multiple costs and benefits across project lifecycle
3. **Refined targets:** Refinement of Kingston's stormwater treatment targets
4. **Asset Descriptions:** Operation, performance & cost of existing & proposed assets

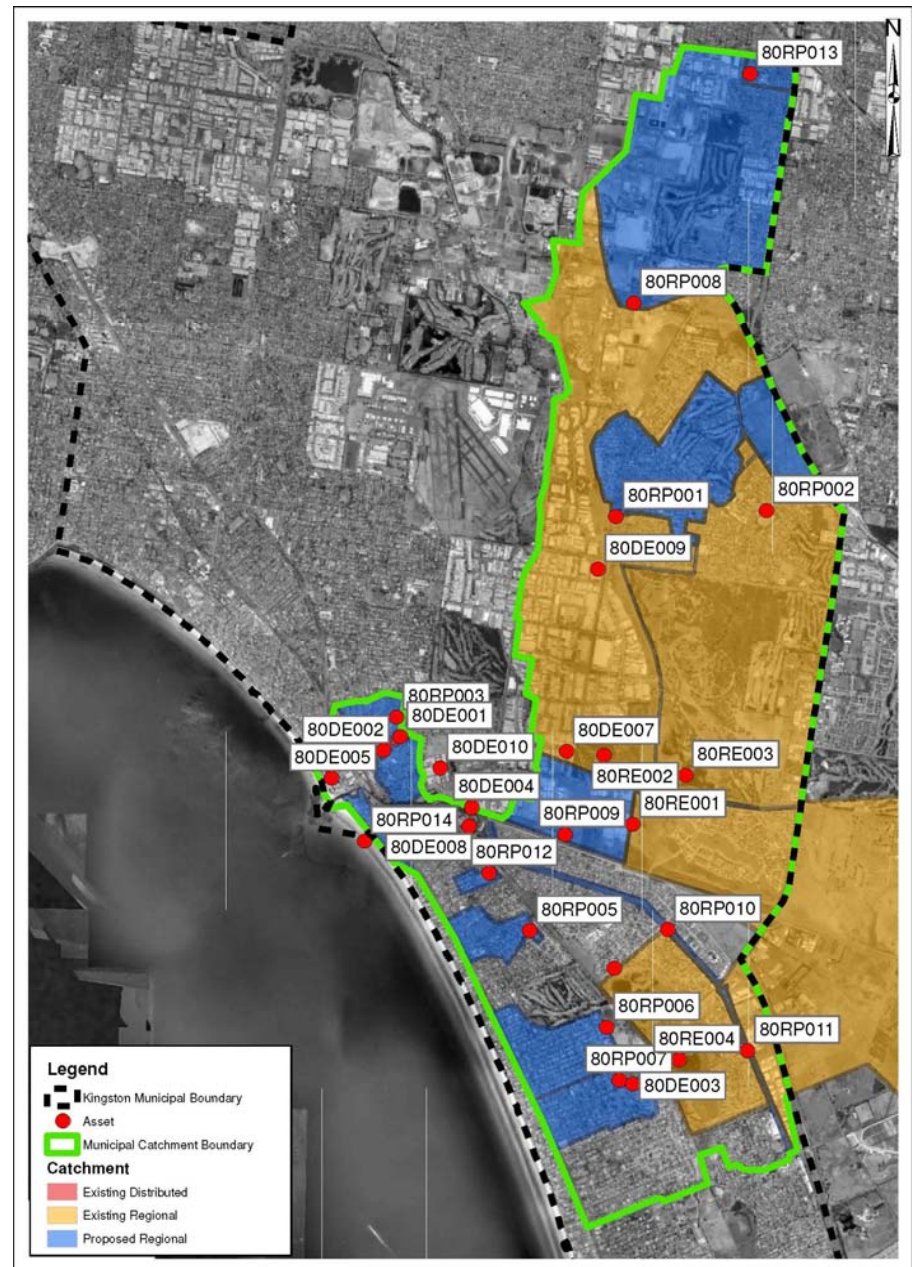

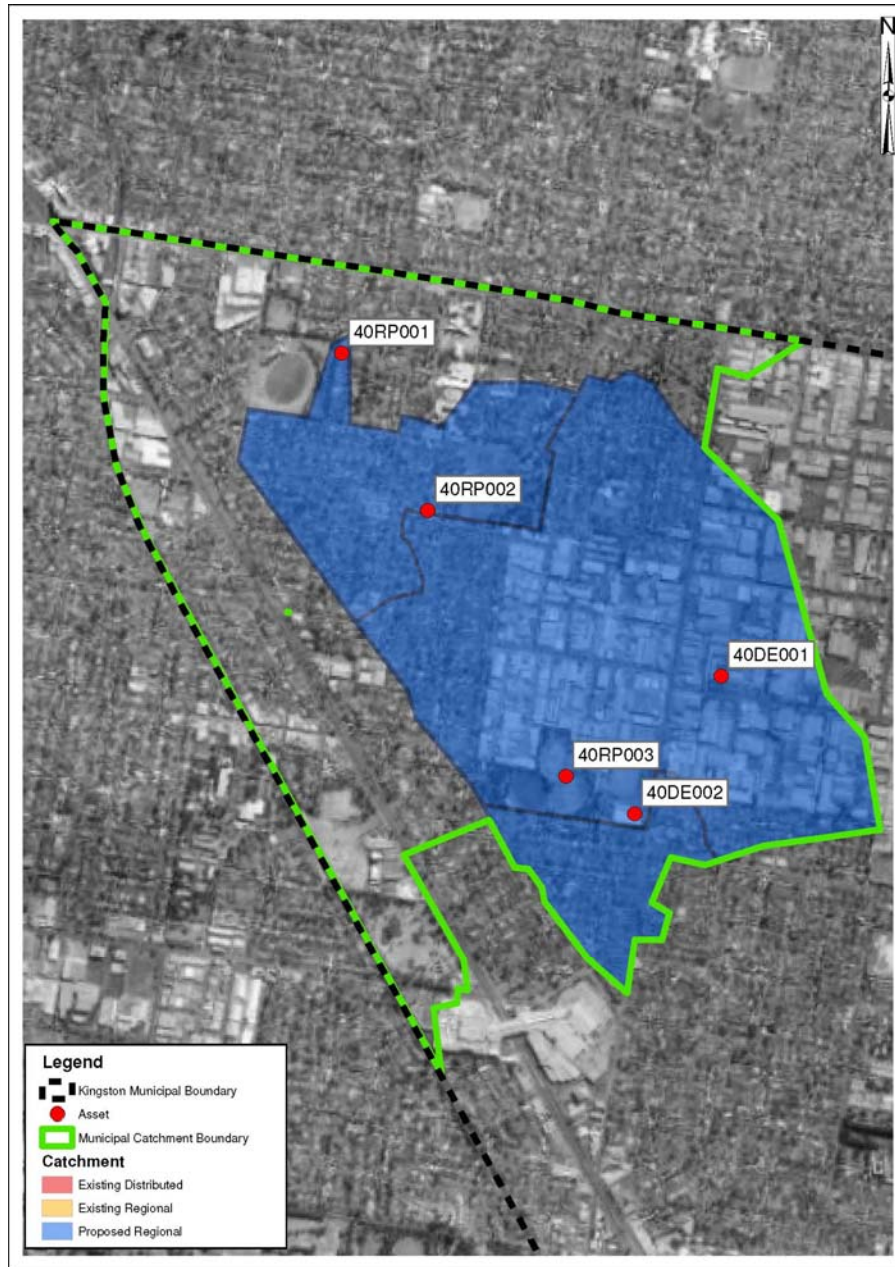

Maps – treatment performance

Maps – harvesting performance

Maps – location of proposed assets

Opportunities

- **Regional:** > 20 ha catchment
 - E.g. divert flows from pipe to a bioretention in a park. Filtered flows stored in tank and used to irrigate sport field
- **Distributed:**
 - E.g. Rainwater tanks and streetscape raingardens

Regional opportunities

- **Long list:** based on GIS catchment info & aerial photos showing potentially available land
- **Short list:** based on site visits and comparison
- Ideal site:
 - Big catchment
 - Lots of unencumbered space
 - Levels allow for gravity diversion
 - Non potable water demand

Asset/opportunity coding

Catchment	Elster
Diversion type	Gravimetric
Treatment type	Bioremediation
Storage type	Above
Funder	Council/PMC
Total catchment area	250 ha
Reuse demand	4 ML/yr
Catchment % improved	70%
Upstream systems	40RP002, 40RP003
Downstream systems	

Description	
Low flow diverted under gravity from a main drain near the corner of Moorabbin Reserve and Bishop Road to a bioremediation in the northern east corner of Moorabbin Reserve. Diverted flows will pass through a GPT before entering the bioremediation system. The bioremediation footprint will be 2,400 m ² with 1,800 m ² of off-site. Treated water will be used to irrigate Moorabbin Reserve. Treated flows will be pumped from the bioremediation to above ground storage tanks. The optimal tank volume (for 4 ML/yr irrigation demand) is 250 kL.	
Benefits	
- Irrigate valuable sporting reserve	
Further investigations	
- Survey to confirm feasibility of gravity diversion	
- Confirm feasibility of diversion, bioremediation and storage construction	

40RP001c: Moorabbin Reserve harvesting Option 3	Kingston Council Diversion Project - regional opportunities
--	--

↓ ↓ ↓ ↓ ↓ ↓ ↓ ↓

40RP001c: Moorabbin Reserve harvesting Option 3

Code component Description

First digit Regional catchment asset is within

Second digit Spare parameter - can be used in future to indicate asset properties

First letter "R" = regional opportunity

"D" = group of distributed assets

Second letter "E" = existing asset

"P" = proposed asset

Last 3 - 4 digits Unique number for the particular asset

Project comparison factor

- Ranks projects based on performance
- Function of:
 - Relative cost per kg of TN removal
 - Relative cost per kL of stormwater used (e.g. irrigation)
- For those that don't like equations
 - **High** project comparison factor = **Good**
 - **Low** project comparison factor = **Bad**

Project comparison factor

- Annual cost

$$\frac{\text{Capital cost}}{30} + \text{Annual maintenance cost}$$

- Reuse Ratio

$$\frac{\text{Annual cost}}{\text{Annual reuse volume (kL)}}$$

- TN Ratio

$$\frac{\text{Annual cost}}{\text{Annual total nitrogen reduction (kg)}}$$

- Project Comparison Factor

$$\frac{\text{Max Reuse Ratio}}{\text{Reuse ratio for project}} + \frac{\text{Max TN Ratio}}{\text{TN ratio for project}}$$

Project comparison factor example: Edithvale Rec Res

Project comparison factor example: Edithvale Rec Res

- Annual cost

$$\frac{\$428,904}{30} + \$11,000 = \$25,297$$

- Reuse Ratio

$$\frac{\$25,297}{8,120} = 3.1$$

- TN Ratio

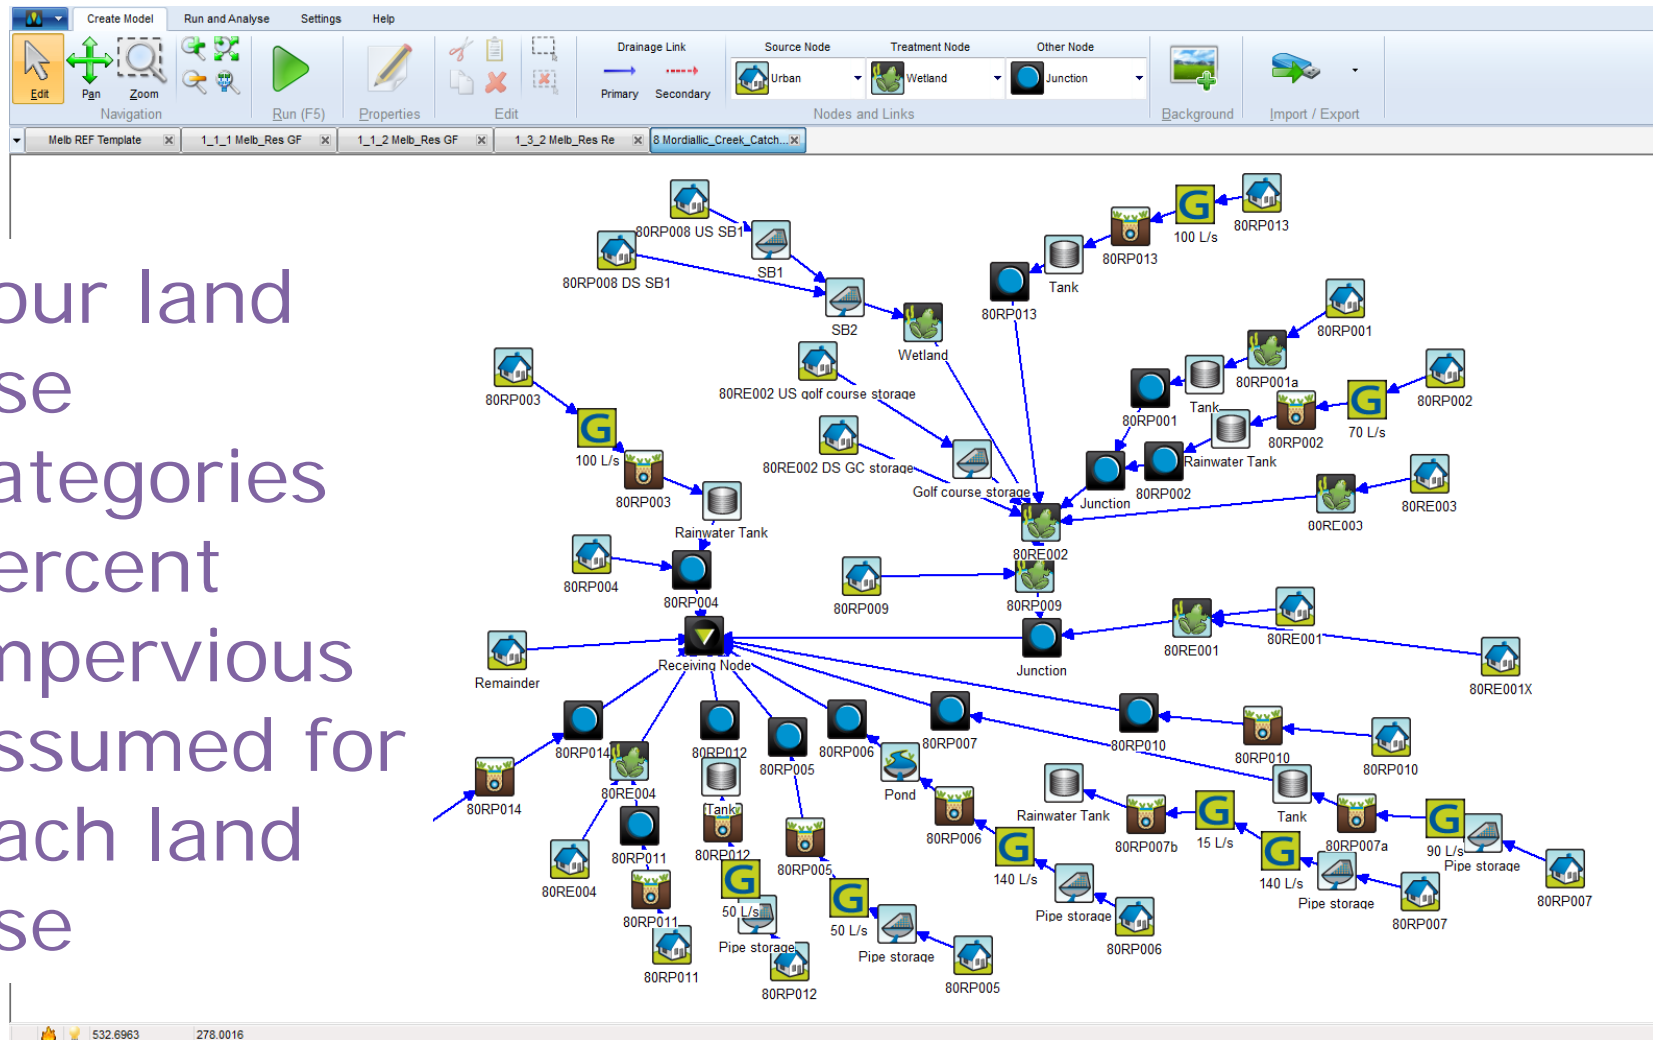

$$\frac{\$25,297}{95.4} = 265$$

- Project Comparison Factor

$$\frac{15.8}{3.1} + \frac{1606}{265} = 11.1$$

Modelling performance

- Four land use categories
- Percent impervious assumed for each land use

Cost estimates

- Capital

- Site establishment
- Diversion from existing drain including pump
- Pipe from diversion to treatment
- Electricity and control
- GPT
- Treatment (bioretention/wetland)
- Pump from treatment to storage
- Pipe from treatment to storage
- Storage
- Reinstatement
- Project management

- Maintenance

- GPT, Pump, treatment, general pits and tanks

Cost estimates

- Items & rates from past experience
- 20% contingency
- Pump cost excluded if needed for flow conveyance
- Site specific costs (e.g. traffic management where works beneath road)
- Differentiated between gravity and pumped diversions
- Assumed treated flows not pumped if underground storage

Prioritisation of large systems

- Cost of treating/harvesting using regional assets ~four times less than distributed

Opportunity type	Project comparison factor range
Regional	1.6 to 54
Distributed	0.2 to 2.1

Cost effectiveness extremes

- **BEST:** "Green wedge harvesting"
(uses open storage)
 - \$1.98/kL of reuse
 - \$129/kg of TN
- **WORST:** Distributed porous paving
 - no reuse
 - \$1,100/kg of TN

Asset descriptions

- Three groups
 - Existing regional (11)
 - Proposed regional (44)
 - Proposed distributed (12)
- Stand alone descriptions in standard format for easy reference
- Could be used as attachments to design briefs, funding applications etc
- More opportunities can be added in future

Catchment	Hydraulic Sediment Drain

Description	Rainfall from residential allotments and road reserves directed to rain gardens within the streetscape. Rain gardens using the standard design shown in the above photo have been installed in many Kingston streets including Stawell Street. This design is used by Council for rain gardens in unconstrained streets (i.e. road reserve greater than 15 m).
	The pollution reductions listed in the quantitative costs and benefits are taken from a report prepared for Council by OHV (Rain Garden Design Evaluation and Review Report). This is the maximum nitrogen reduction achieved for any of the Stawell Street rain gardens.
	The cost estimate listed in the quantitative costs and benefits is taken from the Stawell Street rain gardens Project Description provided by Council. Streetscape rain gardens can help promote awareness of responsible stormwater management, provide passive irrigation of streetscape vegetation and are not reliant on the availability of regional open space.

Kingston Council
Prioritisation Project– distributed opportunities

Learnings

- Many regional opportunities available
- Insufficient space to direct runoff from all areas to large systems
- Prioritise large systems and invest in distributed systems for catchments where large systems not possible
- Refine IWMS targets and confirm future budgets

IWMP targets

Type of target	Target set in Kingston IWCS
Stormwater Treatment	
(i) Short Term	Treat 75 ha every 5 years (or 15 ha/year)
(ii) Long Term	Achieve 100% best practice by 2040 by reducing nitrogen loads discharging into Port Philip Bay by 8,000 kg (at the rate of approx. 300 kg/yr).
Stormwater Reuse	
(i) Storm Term	Reuse 30 ML/year by 2016
(ii) Long Term	Reduce total potable water consumption by 15% (1700 ML) by 2040 and 30% (3500 ML) by 2070.

Revised targets

Type of Target	Revised Target
Stormwater Treatment	<p>Achieve 85% of best practice for the whole of Kingston by 2050.</p> <p>This involves implementation of:</p> <ul style="list-style-type: none">• New regional projects at \$1.3M/year (36%)• New distributed projects at \$0.3M/year (2%)• Private rain water tanks at \$3.0M/year (7%) (600 properties installing 4 kL tanks each year)• Existing Assets (40%)• Maintaining public assets at an ongoing cost of around \$1M/year post 2050.
Stormwater Reuse	<p>Harvest 3,480 ML/year of stormwater by 2050 for irrigation and non-potable uses such as toilet flushing.</p>

Key messages from Council

- Maps powerful for influencing planning permit assessment and works program
- Existing assets need to be accounted for when setting targets
- Council reserves can unlock cost effective opportunities to treat water from large drains
- Project comparison factor very useful to help justify funding and compare competing WSUD projects
